

(First record of this local species which is usually found on ox-eye daisies).

Ceutorhynchus assimilis (Paykull) Lower Millcombe Valley, Quarry Bay and Victoria Beach, 5th to 9th June 1994.

Ceutorhynchus contractus (Marsham) Lower Millcombe Valley, Quarry Bay and Victoria Beach, 5th to 9th June 1994.

Ceutorhynchus contractus var. *pallipes* Crotch Lower Millcombe Valley, Quarry Bay and Victoria Beach, 4th to 9th June, 30th September and 1st October 1994.

Ceutorhynchus pallidactylus (Marsham) [= *quadridens* (Panzer)] Lower Millcombe Valley and Quarry Bay, 5th to 9th June 1994.

Nedys [= *Cidnorhinus*] *quadrinaculatus* (L.) Lower Millcombe Valley and frush above Ladies Beach gulley, 8th June and 29th September 1994.

Hymenoptera

Formica fusca L. Lower Millcombe Valley and Victoria Beach, 5th to 8th June 1994.

Lasius alienus agg. Lower Millcombe Valley and Victoria Beach, 5th to 8th June 1994.

Lasius niger agg. Lower Millcombe Valley, 5th to 8th June 1994.

Hylaeus hyalinatus Smith the reference in the 1993 report to this species should relate to 14th July 1985 (collected by P. Hyman).

Bombus pascuorum (Scopoli) Quarries, 9th June 1994.

Araneae

Pholcus phalangioides (Fuesslin) Stoneycroft, 5th June 1994.

MISCELLANEOUS INVERTEBRATE RECORDS ON LUNDY, 1994

Common Darter *Sympetrum striolatum* (Charp.) 6.10.94 - 7.10.94 (maximum 3)

Green Tiger Beetle *Cicindela campestris* (L.) 19.4.94 - 18.5.94 (maximum ca 50)

Devil's Coach Horse *Ocyrops olens* (Müll.) 6.10.94 (1)

Dor Beetle *Geotrupes stercorarius* (L.) 29.9.94 - 10.10.94 (maximum 10)

Minotaur Beetle *Typhaeus typhoeus* (L.) 9.10.94 (1)

Rosechafer *Cetonia aurata* (L.) 2.6.94 - 5.7.94 (maximum 3)

Dascillus cervinus (L.) 5.6.94 (1). Found by Dr Key on path just south of Knight Templar. This is the second record of this species and the first confirmed one. The specimen has been retained by Dr. Key.

Common Pill Woodlouse *Armadillidium vulgare* (Latr.) 30.4.94 - 6.5.94 (1)

UNCONFIRMED RECORDS, 1994

The following records which appeared in the log are so unusual that they cannot be accepted without confirmation. They are appended here to explain why it is not possible to accept them without more evidence (such as a detailed description, clear photographs or confirmation of the identification by other workers on the island).

Six-spot Burnet *Zygaena filipendulae* (L.) 28.6.94 (2). This species was recorded in 1972 and 1973 but this may have been a misidentification since the record appeared as "Narrow-bordered Six-spot Burnet". It has not been recorded since. In the presence of large numbers of Five-spot Burnets in June, confirmation is essential.

Dark Green Fritillary *Mesoacidalia aglaja* (L.) 15.5.94 (1). There is one unconfirmed and undated record from between 1970 and 1982 (which is not repeated in the recent "Devon Butterflies"). Although it is not impossible that the species could occur on Lundy, the date given in the log is outside the date range for the West Country and its occurrence on the island requires confirmation.

Lesser Stag Beetle *Dorcus parallelipedus* (L.) 9.4.94 - 4.5.94 (maximum 3). This beetle, which lives in dead wood, is unlikely to occur on Lundy. It is, however, similar in appearance to the Minotaur Beetle which is common on the island but is an unfamiliar species to many visitors.
